OFFICERS
OF THE
New England Water Works Association
1942-1943

PRESIDENT

HAROLD L. BRIGHAM, Superintendent, Water & Sewage Commission, Marlboro, Mass.
(Term expires September, 1943)

VICE-PRESIDENTS

HORACE L. CLARK, Superintendent, Water District, Sanford, Maine.
(Term expires September, 1943)

KARL R. KENNISON, Chief Engineer, Metropolitan District Water Supply Commission, Boston, Mass.
(Term expires September, 1944)

DIRECTORS

HAROLD W. GRISWOLD, Deputy Manager and Deputy Chief Engineer, Water Bureau, Metropolitan District, Hartford, Conn.
(Term expires September, 1943)

ARTHUR L. SHAW, Partner, Metcalf & Eddy, Consulting Engineers, Boston, Mass.
(Term expires September, 1944)

DONALD C. CALDERWOOD, Engineer, Pennichuck Water Works, Nashua, New Hampshire.
(Term expires September, 1945)

PAST PRESIDENTS

LELAND G. CARLTON, Superintendent, Municipal Water Works, Springfield, Mass.

FRANCIS H. KINGSBURY, Senior Sanitary Engineer, Massachusetts Department of Public Health, Boston, Mass.

SECRETARY

FRANK J. GIFFORD, Cambridge, Mass.

TREASURER

FRANK J. GIFFORD, Cambridge, Mass.

EDITOR

GORDON M. FAIR, 112 Pierce Hall, Harvard University, Cambridge, Mass.

THE Association was organized in Boston, Mass., on June 21, 1882, with the object of providing its members with means of social intercourse and for the exchange of knowledge pertaining to the construction and management of water works. From an original membership of only TWENTY-SEVEN, its growth has prospered until now it includes the names of 800 men. Its membership is divided into six classes, viz.:

A Member shall be an officer or employee of a public or private water works, an engineer, chemist or other person qualified to aid or interested in the advancement of knowledge relative to water works.

An Honorary Member shall be a person of acknowledged eminence in some branch of water supply or of engineering.

A Junior shall be not less than eighteen years nor more than twenty-five years of age, a student or connected with water supply work.

An Associate shall be either a person, firm or corporation engaged in manufacturing or furnishing materials or supplies for the construction or maintenance of water works.

A Corporate Member shall be either a Water Board, Commission, Company or Municipal Corporation.

The initiation fees and annual dues are as follows:

	Initiation Fees		*Annual Dues*
Members	$ 3.00	Members	$ 6.00
Juniors	1.00	Juniors	3.00
Associates	10.00	Associates	20.00
Corporate Members	10.00	Corporate Members	10.00

This Association has at least eight regular meetings each year, of which five are held in Boston, one in northern New England, one in southern New England, and one, the annual convention, held in September on such date as the Executive Committee may designate.

• Conservation at home is a vital factor in the supply of our armed forces. During the past two years, hundreds of miles of sturdy, long-lasting Lock Joint pipelines have been built to supply vital war projects, yet in the very construction of these lines, more than 80,000 tons of ferrous metals have been conserved for the war effort—enough tonnage to build more than 3,000 medium tanks.

This conservation of metal is possible without any sacrifice of quality because Lock Joint Pipe can be "tailor-made" to any job.

SCOPE OF SERVICES. *Lock Joint Pipe Company specializes in the manufacture and installation of Reinforced Concrete Pressure Pipe for Water Supply Mains as well as Concrete Pipe of all types for Sanitary Sewers, Storm Drains, Culverts and Subaqueous lines.*

LET'S KEEP 'EM MEASURING

TODAY buyers have more reason than ever to be glad that they bought the best quality meters, those designed to last for years. Under present conditions it may be difficult for many to secure all of their requirements in new measuring equipment. Here is when the value built into Pittsburgh-National Meters will prove its worth, for these meters have been designed with those extras that provide high performance standards even after serving a normal life span.

Pittsburgh-National Meters, too, are economical to repair and replacement part stocks are adequate. An intelligent program of meter reconditioning and maintenance can, in many cases, largely supplant the need for new meters.

To aid in keeping them measuring for the duration, we have in recent months reworked many of our old parts bulletins and issued new ones so as to simplify the matter of ordering replacements. Contact the nearest Pittsburgh-National District Office for the literature you need.

WHEN YOU BUY NEW METERS

THE *Empire* VICTORY METER

Top measurement value in so-called War Model Meters is provided by the Empire Victory and the Pittsburgh Ironside. Both have fully rust-proofed cast iron cases; both are fitted with the Pittsburgh-National developed molded glass register lens; both conserve over 70% of the bronze normally used in the construction of meters of this size. After the emergency is over, these meters can be readily converted to bronze cases if desired.

The Empire Victory Meter employs the time-tested, oscillating piston principle of measurement, using the famous Empire balanced piston. The Pittsburgh Ironside Meter is of the popular disc type, having the same time-checking mechanism that has been proven in thousands of Pittsburgh-National Meters in service. Each is a precise measuring instrument, each possessing its own individual characteristics. Together they provide the necessary types to handle practically every domestic meter requirement or preference of water works men.

KEEP 'EM FLOWING!

YOUR JOB—*Continuity of Service*

Continuity of service always has been an industry standard, jealously guarded through floods, hurricanes or mass conflagrations. Now war, this man-made disaster moves in as time's greatest life and death challenge.

To "Keep 'Em Flowing" in the face of this threat, pipe lines must be maintained even though there may not be enough materials for all needs. This is the one phase of *Your Job* which is *Our Job*. Here's how Dresser can help you.

OUR JOB—*Supplying You NOW with the Pipe Couplings and Repair Devices You Need*

Dresser Couplings, fittings, repair clamps, collars, sleeves, are still available. On some items we can make immediate deliveries. On others we can make shipment in a short time. In some instances we may not be able to supply the exact product you specify but frequently we can offer a satisfactory substitute.

So whatever your requirements, wire, write or phone Dresser. You will receive a prompt reply advising you definitely and frankly what we can supply—and when.

HAROLD LEWIS BRIGHAM

President of the New England Water Works Association,
1942-1943

Died January 8, 1943

New England Water Works Association
ORGANIZED 1882

VOL. LVII March, 1943 No. 1

This Association, as a body, is not responsible for the statements or opinions of any of its members

HAROLD LEWIS BRIGHAM

AN APPRECIATION

For the second time in its history, the New England Water Works Association has lost a president during his term of office. Harold Lewis Brigham, who was elected President of this Association in September, 1942, passed away on January 8, 1943. Although he was able to preside at the organization meeting of the Board of Directors in October, 1942, he was not able to take the chair at a meeting of the Association.

Harold Brigham was born in Marlborough, Massachusetts, on February 11, 1893, and after completing his formal education was for a time associated with the Office of the U. S. Engineers and in private employment. In 1922, he entered the service of the Municipal Water and Sewer Department of his native city, and upon being appointed Superintendent of this department, he became a member of the New England Water Works Association. His thorough understanding of the operation of municipal water works caused many a superintendent to seek his advice and manufacturers to appreciate his opinion in water works matters.

Harold Brigham was active in the work of this Association and for several years was Chairman of the Membership Committee. He also served on the Technical Program, June Outing, Finance, and other committees. These activities and the high esteem in which he was held by the members of the Association resulted in his election to the Board of Directors in 1937 and his subsequent election to the Presidency.

Appreciation of his work in his native city was shown by the Mayor of Marlborough in the suspension of all municipal business during the afternoon upon which Harold Brigham

was committed by his Church and associates to the care of his Maker.

The spiritual strength of Harold Brigham was emphasized to those who called upon him in his last days by the courage and tenacity with which he clung to life with the hope of eventually presiding at the meetings of this Association. May we feel that he has been granted this desire and that he, with other honored presidents gone before, will preside in spirit at all of our meetings.

FRANCIS H. KINGSBURY

SUIT YOUR BUILDING TO ITS NEIGHBORHOOD

BY ARTHUR L. SHAW*

[*Received December 22, 1942.*]

Clothes do not make the man, nor is all gold that glitters; neither does the pleasing exterior of a pumping station guarantee the adequacy or efficiency of the equipment housed therein. Nevertheless there is real value in planning buildings for water works, sewerage, or other municipal purposes with superstructures properly related to the neighborhood in which they are located.

Good will is one of the most valuable assets a public utility can have; it can be quickly and permanently lost by erecting a building with an exterior glaringly inappropriate to the character of the neighboring development, even though it may be well suited to its functional purpose. This is particularly true in a residential neighborhood where bitterness may arise on the smallest pretext if the neighbors feel that the alien structure may affect property values. It is similarly undesirable to have a misfit in any type of development.

It is usually possible, at the expense of no more than a little architectural ingenuity, to design the superstructure of a given building on one of three principles. Under the first, it would definitely harmonize with the type of buildings among which it stands, even to the extent of imitating them. This may be offensive to that school of architectural thought which holds that every building should express its function, unashamed; nevertheless it will avoid much local opposition if a building blends with its neighbors as far as possible.

The second alternative requires that the structure, while not attempting to conceal its real purpose, shall either be inconspicuous or express the atmosphere of a locality rather than an immediate neighborhood. Under this plan, opposition can sometimes be forestalled by showing the potential opponents what is proposed to be done and by explaining the manner in which the proposed architecture renders the structure unobjectionable.

Under the third alternative, the architecture will be dictated by

*Partner, Metcalf & Eddy, Engineers, Boston, Mass.

some long-range view which may not yet be apparent on the ground. This is applicable where the type of surrounding development has not yet crystallized, or where the neighborhood so lacks character that the new structure may be depended upon to set the pace, or where a scheme of boulevard or park development may have been even remotely conceived or planned.

Two examples will suffice to illustrate what can be done to blend with neighboring structures. A booster water pumping station in a fine residential neighborhood in Montclair, N. J., is shown in Figure 1.

FIG. 1—WATER PUMPING STATION, MONTCLAIR, N. J.

Here it was attempted, so far as practicable, to follow residential lines. The sewage pumping station at Hyannis, Mass., Figure 2, lies on the edge of a tidal inlet among simple Cape Cod cottages and picturesque water-side buildings. While it is of brick for practical reasons, rather than of the customary wooden construction, its lines are in keeping with those of its neighbors.

In deference to the apostles of "Truth in Architecture" buildings can sometimes express what they are without offense to their surround-

FIG. 2—SEWAGE PUMPING STATION, HYANNIS, MASS.

ings. Appropriate to the Colonial atmosphere associated with the locality, the Salem and Beverly, Mass., water filtration plant, Figure 3,

FIG. 3—WATER FILTRATION PLANT, BEVERLY, MASS.

stands with dignity in a residential section without offense, while making no pretense of concealing its purpose. By contrast, the little filter plant at Hinsdale, N. H., Figure 4, is severely plain; standing as it does

FIG. 4—WATER FILTRATION PLANT, HINSDALE, N. H.

FIG. 5—WATER PUMPING STATION, DRACUT, MASS.

in a field beside a country road, it would be incongruous if designed on other than the simplest lines, in keeping with the small farmhouses that are its neighbors, while not imitating them. Similarly, the plain little booster pumping station at Dracut, Mass., Figure 5, standing in a roadside grove, is appropriate where a more striking or monumental type would be out of place. The same may be said of the Groton, Conn., filter plant, Figure 6, which stands in a location isolated by the water

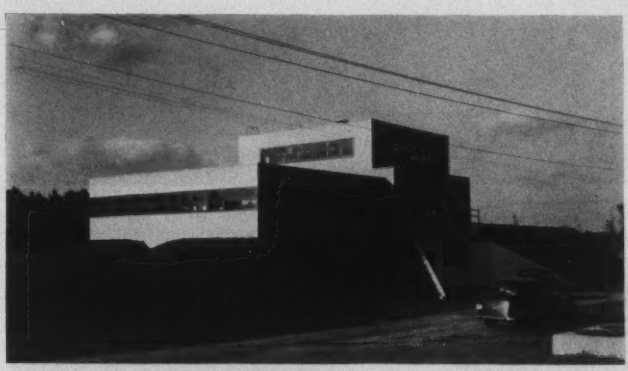

FIG. 6—WATER FILTRATION PLANT, GROTON, CONN.

works reservation where it can properly express its purpose with dignity but without adornment.

Not infrequently it becomes necessary to put buildings in nondescript localities where the type of superstructure is immaterial so far as the effect on the neighborhood is concerned. Other considerations will then govern. At Springfield, Mass., one of the earlier flood-relief pumping stations was built in 1925 at Washburn St., in a relatively poor tenement district; but, since it fronts on the future location of a proposed river-front boulevard, a dignified and mildly monumental structure was selected (Figure 7). Into this classification also falls the pumping station of the Kennebec Water District in Waterville, Me., Figure 8, which lies betwixt residential and industrial developments and needs only sufficient embellishment to give it distinction.

FIG. 7—SEWAGE PUMPING STATION, SPRINGFIELD, MASS.

FIG. 8—WATER PUMPING STATION, WATERVILLE, ME.

None of these buildings cost more to design or to build than was justified by the favorable impression they create and by the friendly attitude they establish toward the utility or service for which they were

built. Furthermore, not the least of the advantages of attractive and appropriate buildings is the pride they stimulate in the operating force, resulting in more conscientious care and maintenance of property and grounds. Clean, well-kept plants cultivate merited public confidence in the safety and adequacy of the product of the utility.

VARIABILITY IN THE NORMAL CHLORIDE CONTENT OF SURFACE AND GROUND WATER SUPPLIES IN MASSACHUSETTS

BY FRANCIS H. KINGSBURY* AND EDWARD W. SMITH†

[*Read September 19, 1942.*]

Recent considerations of the chloride content of certain water supplies at various distances from the sea coast have raised the question whether the normal chloride content of unpolluted waters varies in time due to natural causes. An early map showing the normal chloride content of waters in Massachusetts was published in the 1890 Report of the State Board of Health of Massachusetts. A comparison of the isochlors shown on that map and figures of the normal chloride content of certain Massachusetts waters with more recent analyses would indicate a discrepancy. Accordingly, a study was made of available analyses extending over the period since the early map was published, in order to determine whether variation was due to rainfall. Such studies indicate that a correlative inverse variation does exist.

Search of the scientific literature on the chloride content of air shows in bulletins of the American Meteorological Society that there is a definite relationship between the chloride content of air and the wind velocity. This relationship appears to vary directly with the wind velocity and inversely with the relative humidity. Analyses of fog and rain water have yielded considerable concentrations of chlorides and have shown that the chloride content of fog which had travelled over warm sea water contained a greater amount of chlorides than that which had travelled over cold sea water.

Figure 1 shows the variation in chlorides in Massachusetts with the distance from the coast line. In an attempt to find whether or not the high wind velocities that accompanied the hurricane of September, 1938, had influenced the chloride content of natural waters, curves are presented for ground and surface water supplies for the years 1936 and 1937 as compared with similar plots for the years 1939 and 1940. There

*Associate Sanitary Engineer and †Junior Chemist, Massachusetts Department of Public Health, Division of Sanitary Engineering, Boston, Mass.

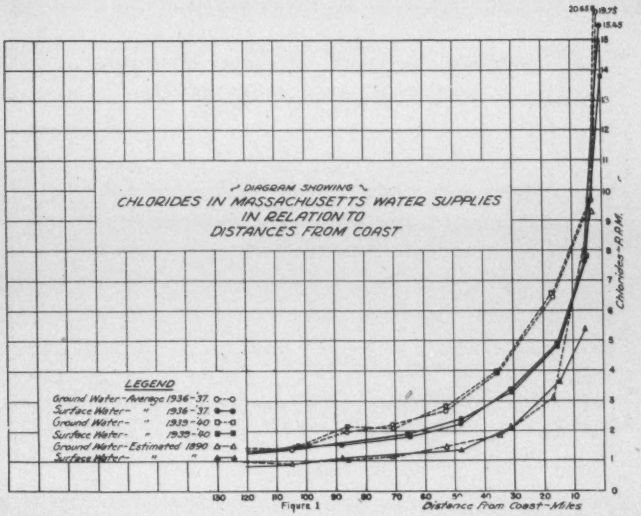

Figure 1

is also shown a plot derived from the map printed in 1890 in order to indicate the variation between 1890 and the present time.

The variation between the ground and surface supplies in 1890 and the more recent records increases with the distance from the sea coast. Notice of the generally higher chloride values for both ground and surface waters in recent years over the figures for 1890 prompted an inquiry as to whether this increase had been progressive or variable. Accordingly, studies were made of the chronological variations in the chloride content of groups of ground and surface waters in comparison with the two-year progressive average rainfall for typical stations. Results for the group of waters occurring 5 to 20 miles from the coast are shown in Figure 2; those for the group 27 to 56 miles from the coast in Figure 3; and those for the group 100 to 125 miles from the coast in Figure 4. A comparison of Figures 2, 3 and 4 will indicate in general that during periods of increasing rainfall the chloride content of both ground and surface waters tends to decrease. The period from 1880 to 1890 was, in Massachusetts one of generally increasing annual

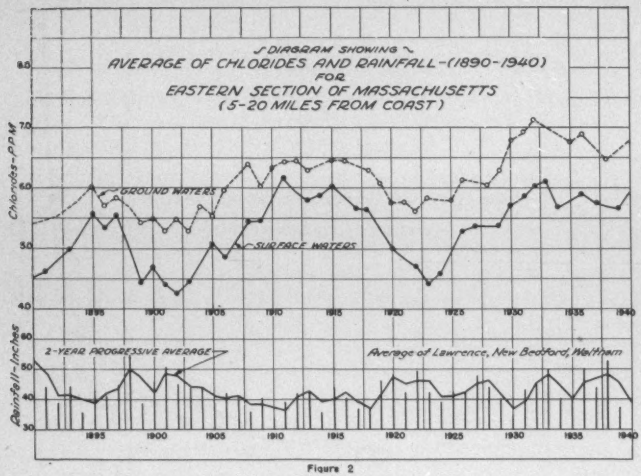

Figure 2

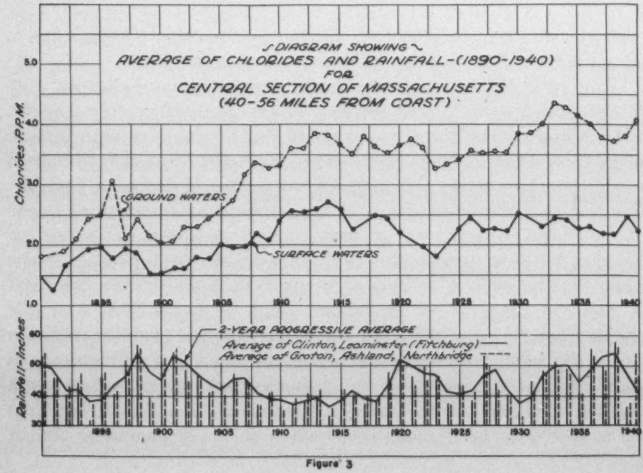

Figure 3

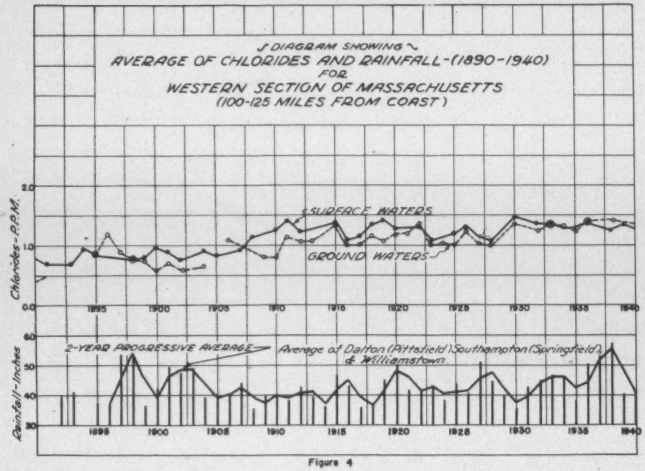

Figure 4

rainfall followed by a period of decreasing annual rainfall for the next five years. There appears to be good reason, therefore, why the normal chlorides as shown on the map prepared in 1890 should be lower than those in more recent years that were associated with lower rainfall.

The variations between the normal chloride for low-chloride periods and those for high-chloride periods are as much as 1.5 p.p.m. in the area within 20 miles of the sea coast. There is a corresponding variation in the 50-mile zone of about 1.0 p.p.m. and a variation in the 100 to 125 mile zone of about 0.5 p.p.m. To visualize this variation we may consider a large mass of air, some of which contains fog, moving inland from the ocean precipitating the chlorides en route, the chloride concentration following a typical "die-away" curve as the movement progresses inland.

It might be argued by one who wished to question the reasons assigned to these variations that the increase in chloride content is due to increase in population and disposal of sewage on watersheds. In connection with this consideration, Figure 5 shows the population per square mile, the chlorides, and the rainfall at Lake Cochituate since 1890. While there would appear to be a correlation between the chloride

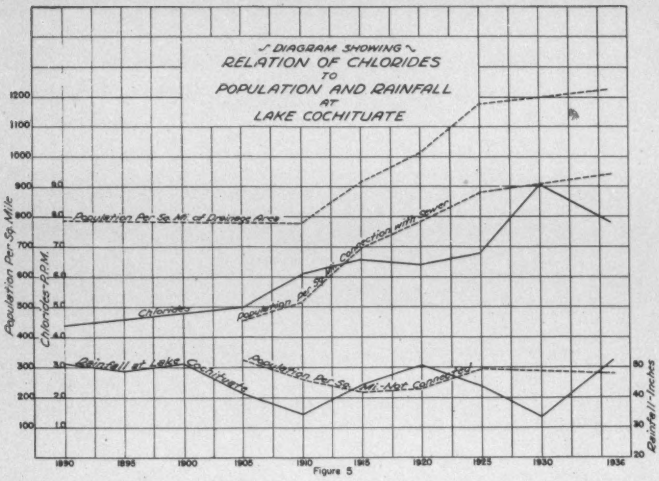

Figure 5

content and the total population per square mile, the unsewered population of this watershed has not increased in the past 40 years. The total increase in chlorides from 1905 amounts to about 3 p.p.m., but the chloride content of the water in Lake Cochituate also responds to variations in rainfall. It is possible that a considerable portion of the increased chloride content of the water of Lake Cochituate is due to increased evaporation in recent years during which the area of the lake has been generally greater than during the earlier years when the lake was being drawn upon regularly for water supply purposes.

Conclusion

From these studies of the variability of the normal chloride content of waters, we may conclude briefly as follows:

1. The chloride content of waters decreases rapidly to a distance of about 50 miles from the ocean, decreasing more slowly farther inland, the limit of our observations in these notes being 125 miles.

2. There is a distinct variation in the normal chloride content of 1.5 to 0.5 p.p.m. of chlorides due to antecedent and concurrent rainfall conditions. This variation, however, in turn decreases with the distance from the sea.

RAINFALL IN NEW ENGLAND

BY GEORGE V. WHITE*

[Received September 1, 1941.]

PART II. RAINFALL IN MAINE, NEW HAMPSHIRE, AND VERMONT†

As pointed out in the introduction to Part I of this paper, the subject "Rainfall in New England" is here presented as a continuation of the tables prepared by the late X. H. Goodnough and published in the Journals of the New England Water Works Association as follows: Vol. 29, No. 3, 1915; Vol. 35, No. 3, 1921; Vol. 40, No. 2, 1926; and Vol. 44, No. 2, 1930. Part I of this paper covers the Rainfall in Massachusetts and was published in the preceding issue of this Journal, Vol. 56, No. 4, pp. 405-502. All rainfall values are expressed in inches.

WATER SUPPLIES AND IRON REMOVAL PLANT, PROVINCETOWN, MASS.

BY PAUL F. HOWARD*

[*Read December 17, 1942.*]

Historical. The Town of Provincetown is situated at the outermost end of Cape Cod, the peninsula extending farthest into the Atlantic Ocean on our whole coast. The soil formation above sea level is sand, surfaced in part with a light covering of sandy loam. This sand, in all probability, was washed and blown up from the sea, as the portion of the glacial moraine that lies above sea level ends at North Truro. The end of the glacial deposit may be clearly seen today as a grass- and tree-covered steep slope at the east of Pilgrim Lake in North Truro.

That portion of the towns of North Truro and Provincetown which lies west of this slope is formed of sand. The only stone visible, other than that brought in by man, is that lying on the outer beach on the north side of Provincetown, and generally speaking that lies below high water. In the course of years, the light sand has been blown out of the loose glacial waste that was deposited on the beaches after being washed by the ocean up the Cape in a westerly direction from the shore cliffs extending from Truro to Chatham. Great areas of the Provincetown region appear as sand dunes. Those comprising the unoccupied and unused portions of Provincetown shift from season to season with the winds and bury from time to time the light loam carpet that nature has been able to build up. Excavations in these areas, therefore, encounter numerous thin layers of loam. Old pictures of Provincetown show East Harbor, now Pilgrim Lake, as a beautiful body of water sheltering many sizeable ships. This harbor today is but a shallow, brackish pond which has been almost filled with wind-blown sand. There are numerous small ponds, averaging one or two feet deep, in this area which are forever changing their contour. These ponds have been formed by a rising ground water table filling depressions previously made by the winds. The bottoms of the deepest ponds are at the ground water level

*Sanitary Engineer, Whitman & Howard, Boston, Mass.

of some previous period as the wind would not erode the wet sand. These ponds are unsuitable as sources of public water supply.

Governor Bradford records in his "History of the Plimouth Plantation" that the party of Pilgrims that went ashore under the leadership of Captain Myles Standish to investigate the suitability of the Provincetown area for the establishment of a settlement, reported that they "were distressed for want of drink and that after they had headed a great creek, they left the sand and turned into the woods. Here, they found water and refreshed themselves and that it being the first New England water they drunk of it was as pleasant unto them as wine or beer had been in for-times".

It is to be noted that the explorers did not find good water until they had left the sand dunes and reached the moraine at the location known as Pilgrim Heights, North Truro. Bradford states that they encountered a pond with clear, fresh water on their way to the hill where they found Indian corn buried (now known as Corn Hill, Truro). This pond is shown in the survey of Simeon Borden made in 1844. It is also shown in the 1887 surveys of the Coast and Geodetic Survey, but as a very much smaller pond.

Municipal Water Supply. There being need of a good water supply and fire protection, the town of Provincetown established a municipal water system in 1893, securing its supply by means of pipe wells at the present location of the local Electric Power Plant. In 1896, there were many complaints about the high iron content of the municipal water supply, and in 1898, a filter basin was constructed at the location of the wells and the wells were abandoned. In six months, however, the water from this filter basin was about as bad as the water from the abandoned wells had been. In 1905 a well, 420 ft. deep, was built, but it was never used, as the water was of poor quality.

In 1906, experimental work was carried out under the direction of the State Board of Health in an effort to find a satisfactory way to remove excessive amounts of iron from the water. It was found that the iron could be removed from the well water by bringing it in contact with metallic iron and filtering it through sand. Iron could not, however, be satisfactorily removed from water drawn from the filter basin due to its deficiency of carbonic acid. It was also found that iron could be removed by the use of aluminum sulphate and filtration through sand. The proposed process was such that the treated water would be

rather hard and might contain objectionable amounts of undecomposed aluminum sulphate.

It was estimated in 1906 that an iron removal plant, using aluminum sulphate, etc., would cost $13,000 and that it would cost $1,345 a year to operate the works.

At the same time that the experimental work on filtration was going on, tests were made for a new water supply by driving wells east of Provincetown in Truro on the higher lands in the undisturbed glacial deposit. The water from these test wells was of excellent quality. There being some uncertainties about the success of the processes of iron removal, the town decided to obtain its water supply from wells in North Truro. In 1907, 2½-in. pipe wells were installed at this location, together with a pumping station, and a 10-in. cast-iron water main was built extending to town, a distance of about four and one-half miles, at a cost of $40,000. Some of these wells are within 800 ft. of salt water. From time to time these wells have been pumped to such an extent as to lower the level of the water in the ground about the wells to sea level and below, thereby causing the salt water that underlies this area to rise into the wells. In order to keep the salt water at such a depth as not to enter the wells, it is necessary to maintain a water level in the well field at least one foot above mean sea level. It is estimated that when the water level in the well field is one foot above mean sea level the salt water is depressed about 40 ft. below mean sea level. Each time that the water level has been lowered excessively, additional wells have been installed, thereby distributing the draft over a greater area and thus raising the water level in the well field. This has been carried on to such an extent that there remains no further area at this location in which to drive wells, as during the summer season practically all of the water stored in the ground and available to wells is now captured.

Recent Developments. Up to the time of our entering the present war, the summer population of the town of Provincetown had increased each year, and there had been a corresponding increase in its water consumption during the summer months. In 1937, since the water supply derived from North Truro could not be extended, the Water Commissioners caused various wells to be driven throughout the sand dunes in Provincetown and found many wells, which when pumped with a hand pitcher pump, freely gave water of good quality. Among

these wells was one driven in what is known as Day's Sand Pit close to a 10-in. water main leading from the abandoned well-water supply to the standpipe. The original well-water supply was only about 1000 ft. from this well in Day's Sand Pit.

Since experience with pipe wells pumped at low rates showed that water of good quality, low in iron, could be obtained, it was decided to

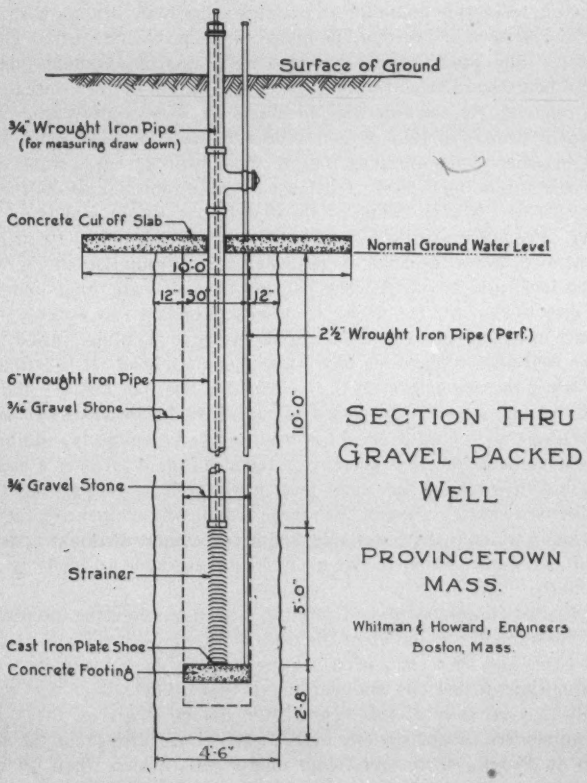

FIG. 1.

investigate further by building a gravel-packed well such that the velocity of the water through the sand as it entered the well would be about 1½ in. per min. when the well was being pumped at a rate of 100 g.p.m. The gravel-packed well was 54-in. in diameter (Figure 1) and extended to a depth of about 17 ft. below normal ground water level. The bottom portion of the well was built in clean, rounded gravel such as is found on the outer beach of Provincetown today. This gravel was probably once the ocean bottom.

The normal ground water level is about 4 ft. below the surface of the ground and was observed to vary, when undisturbed by pumping, from an elevation of 3.4 ft. above mean sea level in January, 1938, to 4.5 ft. in March, 1939. Mean high water in Provincetown harbor, about one-half mile distant from the well, is 4.6 ft. above mean sea level.

Water was pumped from the gravel-packed well continuously for a month at a rate of 100 g.p.m. During this test, the water level dropped in the well about 9 in. to a level about 2.7 ft. above mean sea level, as shown in Figure 2. (Note that the water level was 1.9 ft. below mean

FIG. 2.

high water.) When water was pumped from this gravel-packed well at the rate of 10 g.p.m., it had an iron content of about 0.2 p.p.m. At the rate of 100 g.p.m. the water contained about 2 p.p.m. of iron. The iron content of the water varied up and down with the rate of pumping.

Since the water was unfit for use without treatment, experiments were made to determine a satisfactory way to remove excessive amounts of iron from the water. Whitman & Howard and Mr. Harry W. Clark,

an honorary member of this Association, did this experimental work. The experiments conducted in 1907 on the water from the wells were made by Mr. Clark when he was Chemist of the State Board of Health. The experimental work performed during 1939 showed that the method commonly employed in New England of removing iron from public water supplies by means of aeration followed by filtering through coke and sand was not successful. The experiments did show, however, that this conventional method would work satisfactorily if the water was passed through a layer of 14 in. of marble chips after aeration and prior to filtration.

When two more gravel-packed wells were built, one on each side of the original well and about 250 ft. distant from it, they were joined together by means of 6-in. cast-iron pipe leading to the pumping station. The three wells were designed to be pumped at a combined rate of 300 g.p.m. Based on the pumping test run from January 11 to February 10, 1938, on the original gravel-packed well, it was concluded that three such wells pumped at this rate for three months during the summer would not lower the level of the water in the ground about the wells to within one foot of mean sea level.

This water supply has been in operation three years and no trouble has been experienced with the salt water coming up from below. It is estimated that the salt water is kept depressed under the well field to a depth of about 100 ft. The chlorides contained in the water have averaged about 23 p.p.m.

Operation of New Works. Since the water supply works at North Truro, together with the standpipe, which has a capacity of 1,092,000 gal., have sufficient capacity to meet all but summer demands, the new water supply works were designed to operate only in summer. The maximum quantity of water pumped during one day from these wells was 864,000 gal. on July 20, 1933. The new works are operated automatically without an attendant. A water pressure switch mounted on the switchboard in the new pumping station starts the low-head pump when the water level in the nearby standpipe falls to a predetermined level. The low-head pump draws the water from the wells at a rate of 300 g.p.m. and sprays it into the air to a height of about 3 ft. over a marble filter, the water dropping onto the marble at a rate of 74 m.g.d. per acre. After passing through the 14-in. layer of marble chips, supported by 9 in. of gravel over concrete slats, the water drops through

the air a distance of 3 ft. and then flows by gravity to the spray nozzles over a coke filter where it is again sprayed about 3 ft. into the air and then drops onto the coke at a rate of 74 m.g.d. per acre. After passing through 7 ft. of coke supported on concrete slats the water drops through the air a distance of 3 ft. and then flows by gravity to a modified slow sand filter containing about 2 ft. of sand, taken from the nearby pit. The rate of filtration is 20 m.g.d. per acre. The water finally enters the clear well under the pumping station. The rate of flow through the sand filter is controlled by a conventional, 6-in. rate-of-flow controller located between the outlet from the filter and the inlet to the clear well. The water is pumped from the clear well at a rate of 300 g.p.m. into the 10-in. pipe line running direct to the standpipe. The high-head pump is automatically controlled by means of a float switch actuated by the water level in the clear well. The various units of the purification works are shown in Figures 3 to 6.

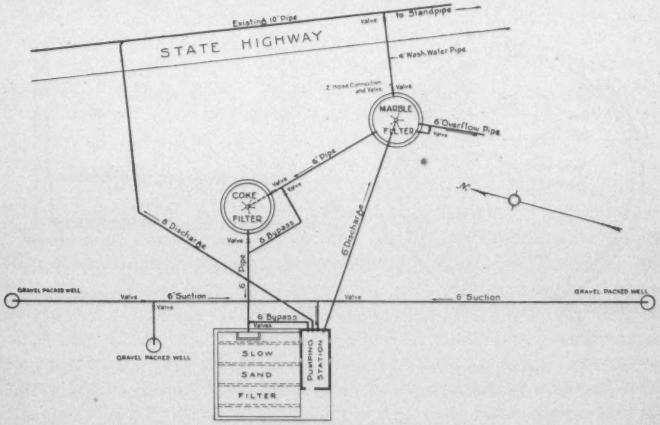

FIG. 3—GENERAL PLAN OF WELLS AND TREATMENT WORKS.

Both water pumps are electric motor driven and are kept primed by means of a vacuum tank set higher than the pumps. The air is exhausted from the vacuum tank by an electric motor driven vacuum

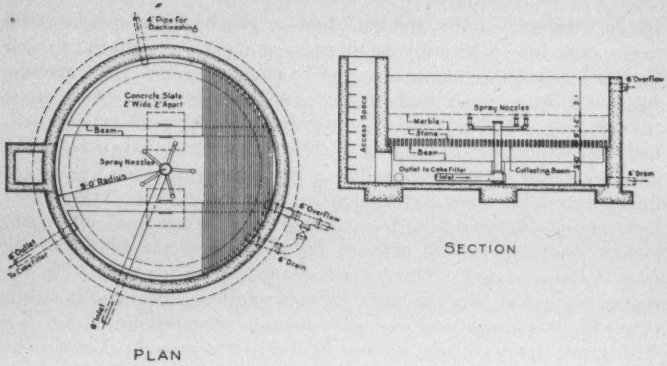

FIG. 4—MARBLE FILTER.

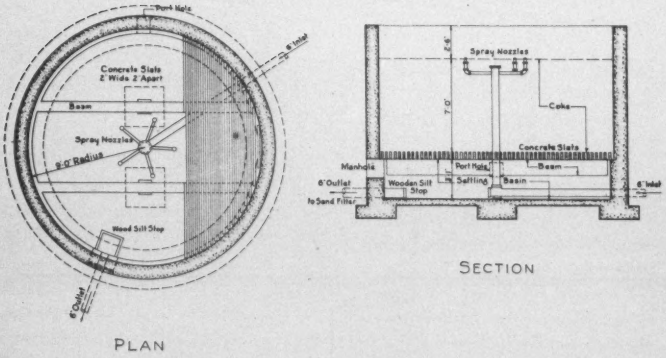

FIG. 5—COKE FILTER.

pump, the operation of this pump being automatically controlled by an electric switch actuated by the water level in the vacuum tank. A cut-out switch is provided to stop all pumps should the water level in the vaccum tank fall below a safe level.

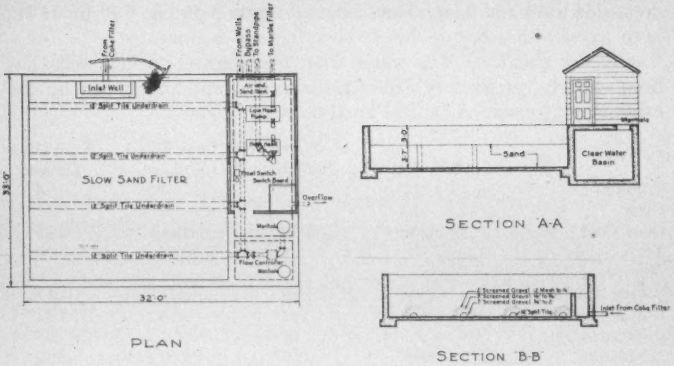

FIG. 6—SLOW SAND FILTER.

All three filters were built in the open without covers as they are to be operated only in the summer months. At the time the plant was designed, the question was raised as to whether the filters ought to be closed in to avoid the growth of algae, especially on the slow sand filter. No trouble, however, has been encountered from algae or other organisms.

The plant is arranged with by-pass piping and valves in such a manner that it may be operated without the coke filter, sand filter, or both. A 4-in. main was laid from the nearby distribution water main to provide for back-washing the marble filter at low rates, and a 2-in. hose connection with hose and nozzle was provided to wash the surface of the bed of marble chips. The marble chips become coated with a heavy deposit of iron rust which is washed off into a 6-in. overflow pipe that discharges onto the ground nearby. Laboratory experiments have shown that if it should become necessary, the iron can be removed very readily from the marble chips by applying a little hydrochloric acid to the wash water.

The marble filter is circular in shape, with an inside diameter of 18 ft. and the walls and floor are constructed of reinforced concrete. The coke filter is the same diameter and is of similar construction, although somewhat deeper. The sand filter is 31 ft. square, with con-

crete side walls and floor. The pumping station building, 9 ft. by 21 ft., is of wood with asbestos shingle covering and is unheated.

Water Quality. The water from these gravel-packed wells has been entirely satisfactory after treatment, as was anticipated by the experimental work. A typical analysis is as follows:

	Raw Water	Marble Filter Effluent	Coke Filter Effluent	Sand Filter Effluent
Turbidity	10	5	4	3
Color	50	32	25	17
Odor Cold	none	none	none	none
Total Solids	78	85	84	79
Nitrogen as:				
Free Ammonia	.036	.040	.026	.012
Albuminoid Ammonia	.062	.082	.058	.052
Nitrates	.05	.05	.12	.05
Nitrites	.000	.000	.000	.000
Chlorides	22.4	22.4	23.4	23.0
Hardness	18	22	22	22
Alkalinity	8	16	13	13
pH	5.5	6.2	6.8	6.8
Iron	1.6	.80	.35	.18
Manganese	.08	.06	.06	.08

Analytical results, except for odor and pH, are given in parts per million.

Reference was made in the second paragraph of this paper to the thin layers of loam buried in the sand. Doubtless the organic matter in these thin layers of loam is responsible for the disappearance of dissolved oxygen from the water and this, in turn, causes the iron to be reduced from an insoluble to a soluble form, largely bicarbonates, when the water is drawn at rates much greater than the natural rate of flow through the ground. The ferrous bicarbonate then comes from the wells in solution in the water, but upon exposure of water to the air it precipitates as ferric hydrate. The experiments and practice at Provincetown have shown that the passing of this water through marble chips greatly facilitates this precipitation process.

PROCEEDINGS

NOVEMBER 1942 MEETING

HOTEL STATLER, BOSTON, MASS.

Thursday, November 19, 1942

Vice-President Horace L. Clark in the chair.

Secretary Gifford announced that the Executive Committee had elected the following to membership: Eugene F. Shyne, Water Commissioner, Sharon, Mass.; Patrick Joseph Doran, Chairman, Water Department, Amesbury, Mass.; Charles B. Hardy, Superintendent, Bureau of Water, Worcester, Mass.; and Roy W. Smith, Water Commissioner, Amesbury, Mass.

A paper "The Variability in the Normal Chloride Content of Water of Surface and Ground Water Supplies in Massachusetts", prepared by F. H. Kingsbury, Associate Sanitary Engineer, and E. W. Smith, Junior Chemist, Massachusetts Department of Public Health, was read by Mr. Kingsbury. E. Sherman Chase and Allen M. Symonds took part in the discussion.

A sound film, "Portable Water Purification Plant", was shown, describing the construction and operation of the U. S. Army Unit.

War films were shown, including "The Midway and Coral Sea Battle", "Pearl Harbor", and "The Fight For Egypt". A film of the burning of the *Normandie* was also shown.

DECEMBER 1942 MEETING

HOTEL STATLER, BOSTON, MASS.

Thursday, December 17, 1942.

Vice-President Horace L. Clark in the chair.

A paper "Iron Removal Plant at Provincetown, Mass.," was read by Paul H. Howard of Whitman and Howard, Consulting Engineers, Boston. Roger W. Esty, Chairman Clark and Arthur L. Shaw entered into the discussion.

A talk "Observations on Sanitary Works in Latin America" was given by Gordon M. Fair, Professor of Sanitary Engineering, Harvard Graduate School of Engineering, Cambridge, Mass. The paper was illustrated by lantern slides.

There was shown the latest release of sound films from the Office of War Information, Washington, D. C., including the following: "United States News Review"; "Manpower"; "The Arm Behind the Army".

JANUARY 1943 MEETING

Air Raid Precautions School for Water Works Instruction Conducted With the Cooperation of the Office of Civilian Defense

HOTEL STATLER, BOSTON, MASS.

January 20 and 21, 1943

Horace L. Clark, Vice-President of the New England Water Works Association, presiding.

The following topics were presented: "Objectives of the Course" by Major Howard H. Potter, Regional Sanitary Engineer, O.C.D.; "Organization of Civilian Defense" by Dr. Dudley A. Reekie, Medical officer, O.C.D.; "The FBI War Investigative Jurisdiction" by John T. Madigan, Special Agent in Charge, F.B.I.; "When the Bombs Fall" by Albert B. Konz, O.C.D.; "Experiences of An Ambulance Driver in the Battle of Egypt" by Hammond Douglas, Jr.; "High Explosives and Incendiary Bombs" by George B. Rowell, O.C.D.; "Delayed Action Bombs and Bomb Reconnaissance" by Lieutenant Robert L. Starr, First Service Command; "Elements of Teaching" by Lieutenant Robert L. Starr; "Effects of Bombings on Structures and Other Installations" by Professor Walter C. Voss, M.I.T.; "Effects of War Gases on Water Supplies" by Major Howard H. Potter, O.C.D.

The School was addressed by Joseph M. Laughlin, Regional Director, First Civilian Defence Region, O.C.D.

The chairman announced the deaths of A. W. Brown, Superintendent, Fitchburg Water Works, and of Harold L. Brigham, President of the New England Water Works Association. Francis H. Kingsbury read an appreciation of President Brigham (See p. 1).

Secretary Gifford read the following letter from Mrs. Brigham:

"I want to tell you how much we appreciated the sympathy extended to us and the many, many acts of kindness shown us by the members of the New England Water Works Association at the time of Harold's sickness and death. His service with the New England Water Works Association was a source of justifiable pride to him. The friendships he made with both the present and former members of the Association had a very special place in his heart, and he treasured them with much pride. The visits by the members of the Association gave Harold real pleasure, and we are grateful to him for the happiness which these visits afforded him. We can never fully show our appreciation to the men who gave blood for the many transfusions he had. It was a wonderful sacrifice for them to make when so many other things are taxing their strength in these trying times. In closing let me again thank you, and I know Harold joins me in saying, 'May God bless you all'.

Sincerely,

(Signed) Alice D. Brigham."

Secretary Gifford announced the election of the following new members: Ellsworth A. Richardson, Superintendent and Treasurer, Water and Light Department, Littleton, N. H.; Edwin Blaine Cobb, Assistant Engineer, Metcalf and Eddy, Belmont, Mass.; Edwin Morey Howard, Whitman and Howard, Inc., Winthrop, Mass.

OBITUARY

Samuel Elbridge Killam

Samuel Elbridge Killam died in the performance of his duties and at the peak of a distinguished career as an engineer in the public service, on June 18, 1942. He was born in Reading, Massachusetts, April 18, 1878, the son of Joseph Warren Killam and Mary Killam. He joined the newly organized engineering force of the Metropolitan Water Supply System as a youngster just out of school on August 3, 1897. It was then known as the Metropolitan Water Board, later as the Water Division of the Metropolitan Water and Sewerage Board, and since 1919 of the Metropolitan District Commission. He showed a lively interest in every detail of the new project. For the first five years his duties were generally in the making of surveys and in supervising the construction of large distribution mains. His associates on the Board report that he became efficient in many branches of surveying work and as time went on was one of the most trustworthy and dependable men in the organization, always straightforward in his dealings, tactful, and a good mixer, yet dignified with a reserve which did not permit familiarities but was filled with kindly understanding. These attributes commended him to Dexter Brackett who was then in charge of the Distribution Department. Mr. Killam was given charge of the general office and later, in 1908, was made Superintendent of Pipe Lines and Reservoirs in the Distribution Department. In spite of his youth, his good judgment and tact and his efficient handling of workmen in difficult situations more than justified his appointment. The members of the Association are very familiar with the efficient manner in which he performed his duties. Mr. Killam held the position of Superintendent of the Distribution Section of the Water Division until 1936 when he was made Deputy Chief Engineer of the Water Division. He succeeded to the position of Chief Engineer in September, 1938. His advancement was due to native ability and application to study and hard work. He was a self-made man in the best sense of the word.

Mr. Killam showed the same diligence in the many services which he gladly rendered to this Association, of which he was President in

1919. He was also Past President of the Engineering Societies of New England and of the Massachusetts State Engineers Association, and he was a member of the American Water Works Association and of the Society of Military Engineers.

He was universally liked and respected and made many firm friends. He was a conscientious public official, and in his passing the Commonwealth has lost one of its ablest public servants who holds a high place among his illustrious predecessors associated in the development of the Metropolitan Water Supply.

In addition to his professional associations, Mr. Killam was a member of the Good Samaritan Masonic Lodge and Past High Priest of the Reading Royal Arch Masonic Chapter. He was also a member of Security Lodge of the Independent Order of Odd Fellows. He was a member of the Old South Church. He is survived by his widow, Mrs. Dora H. Killam; a brother, William H. Killam; a nephew, Elson T. Killam, a member of this Association; and other nephews and nieces.

KARL R. KENNISON
ARTHUR D. WESTON

OBITUARY

HAROLD LEWIS BRIGHAM

Harold L. Brigham, President of the New England Water Works Association, died on January 8, 1943, at the Thorndike House of the Boston City Hospital, where he had been confined by a serious illness for about eight weeks.

Born in Marlboro on February 11, 1893, Mr. Brigham was educated in the Marlboro Public Schools, and at Williston Seminary. Subsequently he took special courses of study in Civil Engineering. In the pursuit of his chosen profession, he served as Assistant to the City Engineer of Marlboro on sewer, drain, and highway construction, as an Inspector and Engineer for the U. S. Engineers, War Department on Ohio River improvements, was with the Raymond Concrete Pile Co. of Baltimore, Md., on concrete drydock construction, and was engaged in highway construction as a contracting engineer. Re-entering the municipal service of his native city in 1922, Mr. Brigham was

advanced to the position of Superintendent of the Marlboro Water and Sewer Department in October 1932, at which time he became a member of the New England Water Works Association.

As a member of the Association's Technical Program, June Outing, and Finance Committees, and as Chairman of the Membership Committee, he lent strong support to the Association. Harold was an active participant in the Superintendents' Meetings where his opinion on management, construction, and operation problems was appreciated. He served as Director of the New England Water Works Association from 1937 to 1940, was Vice President from 1940 to 1942, and was elected President in September 1942. Although he presided at the organization meeting of the Board of Directors, in October, his illness prevented him from presiding at a regular meeting of the Association.

Mr. Brigham served as Zone Coördinator for the State Department of Public Health in connection with its War Emergency organization, and was active in civic affairs serving, at the time of his death, as Director of the Marlboro Chamber of Commerce and as a member of the Board of Directors of the Marlboro Coöperative Bank.

Mr. Brigham is survived by his wife, Mrs. Alice Dwyer Brigham and four daughters, Anne, Marion L., Alice and Margaret Lucille; his parents, Mr. and Mrs. Clarence H. Brigham, a brother, Algernon Brigham, and a sister, Mrs. William Turner.

Harold was a conscientious engineer, an ingenious operator, a faithful servant to his native community, and a true friend to his acquaintances. Highly respected by his fellow citizens and his professional associates, his passing is a distinct loss to the Association which had so recently honored him by elevating him to its Presidency.

The New
Magni-Vision All-Glass Bonnet
is an outstanding improvement on Hersey Disc Meters. Waterworks officials have quickly noted among its many advantages, the magnification of the face of the dial and greater distance from which reading is more rapid and accurate. Reading is a very important factor under present working conditions.

CUBIC FEET
BOSTON, MASS.

A Nation-Wide Trend...

THOUSANDS of communities have installed *Transite Pipe for water lines.* Today, virtually the entire production is being used for war. Whether for civilian or military use, these advantages mean efficient, low-cost water transportation:

Easy to handle—Transite is light in weight. Only the larger sizes require mechanical handling equipment.

Rapid Assembly—Even unskilled crews can form tight joints quickly and easily with the Simplex Coupling.

Low Maintenance—High corrosion-resistance is a feature of Transite's asbestos-cement composition. This advantage helps make possible Transite's low maintenance.

No Tuberculation—Transite's initial high flow-coefficient (C-140) can never be reduced by tuberculation.

Tight, flexible joints—The modern Simplex Coupling permits deflections of as much as 5° at each joint.

FOR DETAILS, write for Transite Pressure Pipe Brochure TR-IIA. Johns-Manville, 22 E. 40th St., New York, N.Y.

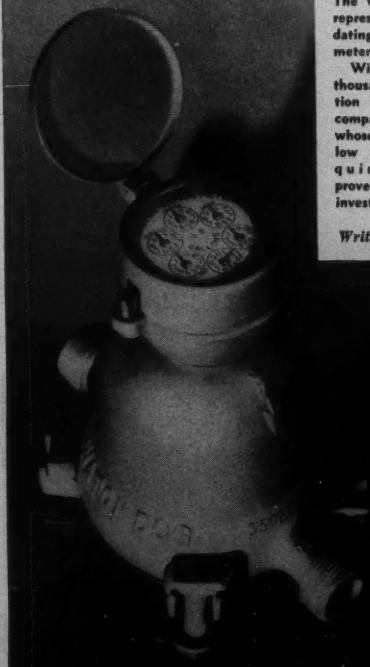
WATCH DOG WATER METERS

. . . built to give LASTING SATISFACTION

The Worthington-Gamon Meters of today represent an experience of 85 years . . . dating back to the invention of the piston meter, in 1855, by Henry R. Worthington.

With 3,650,000 meters now serving thousands of communities, this organization offers to municipalities and water companies a product whose accuracy and low maintenance requirements have proved it to be a sound investment.

Write for literature.



WORTHINGTON-GAMON METER COMPANY
General Offices: HARRISON, NEW JERSEY

WORTHINGTON-GAMON

WG1-2A

BY SENSE OF TOUCH ALONE . . . .

"It is a pleasure for me to inform you that, even tho' I am without sight, I have worked in the Meter Shops for Salt Lake City for a little over six years and that I find it easier to repair TRIDENT Water Meters than any other make with which we come in contact."

Statement by
MR. HUBERT COCHRAN

"Trident Meters are easier to repair"

says "HUB" COCHRAN, who repairs TRIDENT METERS by sense of touch alone in the Salt Lake City Meter Shops

And the Trident meters repaired by "Hub" measure up to the same standard of accuracy as those handled by the unhandicapped men in the shops—that is, from 98% to 100%. Truly, this is a fine tribute to Trident simplicity—and to the judgment and skill of an expert workman.

★ ★ ★ ★ ★ ★ ★ ★ ★ ★ ★ ★ ★

The fact that Trident Meters are not difficult to repair means that a program of systematic meter-testing-and-repair need be neither expensive nor complicated for your community. Such a program will substantially reduce water waste and, through many resultant savings (in pumpage, coal, chlorine, transportation) will help your Water Works contribute materially to winning the War. At the same time, you will materially increase the percentage of water accounted for by meters, and thereby substantially increase your revenue.

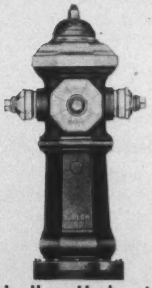
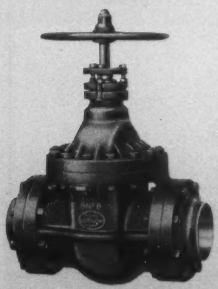
PRIORITIES . . .

a necessary blessing!



Ludlow Hydrant



Ludlow Gate Valve

A Necessary Evil? — this was our first impression of the Priority idea and its restrictions on buying, manufacturing and selling. But as we saw America answer the Axis threat, we came to regard the pinch of Priority as a Necessary Blessing!

We are glad to be able to give Uncle Sam our best efforts. We are glad, too, that a portion of our production may be allotted to our friends in the water works field who have priority rating. In real necessity, a high priority rating is usually granted. But without it, regulations do not permit us to fill orders promptly.

To aid our customers, we will furnish them with interpretations of priority regulations and amendments sent us by the War Production Board. We will serve you in every possible way till Victory allows our usual complete fulfillment of your valued needs.

THE LUDLOW VALVE MANUFACTURING CO., Inc.

LUDLOW SINCE 1866 VALVES

TIGHT JOINTS

REGARDLESS OF PIPE SIZE OR SOIL CONDITION

UNDER all conditions of service cast iron water mains can be laid with assurance of permanently "bottle-tight" joints if HYDRO-TITE is used as the jointing compound.

No matter how large or small the pipe nor how tough the going may be, HYDRO-TITE will prove the easiest and most economical to use.

HYDRO-TITE has a record of more than a quarter century without a failure anywhere.

FOR OVER 50 YEARS

Sincerely yours

HAS BEEN PROUDLY INSCRIBED, IN EFFECT IF NOT IN FACT, ON THOUSANDS OF BUILDERS FLOW METERS AND CONTROLLERS!

OLD GLORY

and the Army-Navy "E" Pennant

fly above our foundries and shops where the wheels of industry are humming night and day in the united effort for freedom's preservation.

More permanent, however, than the products for war are BUILDERS VENTURI METERS, VENTURI CONTROLLERS, and CHRONOFLO TELEMETERS in the water supply systems and purification plants throughout the United States. Day in and day out, they play a vital role in the economical production and conservation of the water supply.

Back in the old days, second-rate Roman sculptors who could apparently not do marble would secretly patch up the flaws with a mixture of wax and marble dust. These patches would drop out when moving began, leaving so much that they began labelling their handiwork "Ne Caveas Imperfecta." Without Wax. Even today we strive for work without imperfections. Without wax.

ARMY E NAVY AWARDED AUG. 1st 1942

SAFETOP Saving the Time- Fire Hydrant

Time-Saving on Response

. . . because the simple, straightline mechanism of the Kennedy Safetop functions smoothly no matter how seldom the hydrant may be operated, and the large unobstructed passageways throughout the hydrant reduce friction to a minimum.

Time-Saving on Repairs

. . . because, if broken by a smashing impact, the Kennedy Safetop can be returned to service within half an hour, by one man, with a few standard tools, without excavating, and at a total cost of less than $10 for repair parts and labor.

Time-Saving on Adjustments

. . . because no excavation is necessary to reach the operating parts, to change the nozzle positions, or to lengthen the hydrant for raise in street grade; and because the only required maintenance attention is a few minutes a year.

Write for bulletin describing this hydrant; termed by water department superintendents as "the most important advance ever made in fire hydrant design."

The Kennedy Valve Mfg. Co., Elmira, N. Y.

KENNEDY SAFETOP FIRE HYDRANT

REG. U.S. PAT. OFF.

EDDY

Valves and Hydrants

Distinctive Features of the EDDY Valves

ONLY three parts are moved by the Stem—the ball and the two gates. Each gate is hung from one of the trunnions on the ball. A convex surface at the base of each trunnion fits a concave surface on the back of the gate. This allows the gates to adjust themselves properly to their seats. . . . The gates, being free to revolve on the trunnions, do not always seat in the same position. Gates are center bearing and adjustable. They are forced to their seats with equal pressure at all points. There are two hooks on the ball on sizes 4-inch and larger, which loosely engage with the gates.

Distinctive Features of Our New Swivel Top Hydrants

THIS new hydrant has all the advantages of the popular EDDY fire hydrant, plus several additional features. . . . Nozzles are in a short flanged section of the standpipe, which may be unbolted and turned to different positions. . . . Should the standpipe be broken, only the casting below the swivel head need be replaced.

. . . To raise the hydrant to conform to a new grading, simply insert a flanged extension piece below the swivelhead. No digging. To add a steamer nozzle at any time, it is only necessary to replace the swivel head with one having a steamer nozzle.

Besides valves and hydrants to meet the most exacting demands of waterworks service, the complete EDDY Line includes: valves for sewage disposal works; valves for steam, gas and oil; check valves, foot valves, plug valves, shear gates, indicator posts, etc. EDDY valves are made in three classes: Iron Body Bronze Mounted, All Bronze, and All Iron Valves.

Eddy Valve Co.

WATERFORD NEW YORK

WHEN LAYING WATER MAINS TODAY . . .

Remember that joints caulked with lead are soft and flexible . . . take up normal pipe movement without leakage . . . stay tighter longer.

Remember, too, that there is no current shortage of lead . . . no ruling which prohibits the use of lead for caulking purposes.

We furnish lead either in ingot form for cast joints or as lead wool for cold caulking. Both carry the Lead Industries Association Seal of Approval—a guarantee of their purity.

National-Boston Lead Company

STRONG-HEARTED WATER-SYSTEMS

Pumps are often referred to as the "heart" of a water supply system. Where Morris Pumps are installed, the water department superintendent quickly learns that the heart of his system will function faithfully and efficiently. Morris Water Supply Pumps are making records for high efficiency and trouble-free service all over the country. The features that reduce hydraulic and mechanical losses and wear to a minimum are concisely described in Bulletin 164 which will be sent on request.

have you looked HERE for that EXTRA PLANT CAPACITY?

Although chlorination is not a substitute for adequate filter capacity, it can often go a long way to carry you safely through a period of increased demand that puts an abnormal burden on your plant.

Your *present* chlorination equipment, used to full advantage, may serve to meet the problems arising from the fact that plant expansion is "out" for the duration. More and more, cities and towns in busy war areas are adapting their chlorination procedure to this capacity-stretching goal. Stand-by units are being pressed into full-time service; prechlorination is being applied so as to relieve the load on filters; "break-point" chlorination is maintaining safety in spite of inadequate facilities.

No one set of recommendations can meet the problems of overburdened plants. However, your Wallace & Tiernan Representative is ready to bring his wide range of experience to bear on your particular conditions. He'll see that your Chlorinators are properly adjusted, and advise on points and rates of application to get the greatest safety-value from every pound of chlorine. Whether you're "up against it" for plant capacity or merely being forearmed, the W&T Representative can furnish practical suggestions for wartime water safety. SA-145-S

"THERE'S NO ECONOMY LIKE MATHEWS HYDRANTS AND A FEW SPARE BARRELS"
It's a lucky community—with wise executives—that NEVER has to dig up fire hydrants. In fact, it's a town with Mathews Hydrants. For that removable barrel—it simply unscrews from the elbow—can be lifted right out through the loose Mathews protection case, and it contains all operating parts! Whether you want to inspect or overhaul, renew valves or valve seats or repair a traffic smash, raise or lower the street level, just haul out the barrel, replace it with a spare, and do all the rest conveniently in the shop. Mathews Hydrants are a peace-time economy—a war-time necessity.

WROUGHT IRON PIPE. (See Pipe, Wrought Iron and Steel.)

Now CAST IRON PIPE BECOMES EVEN *more* ECONOMICAL

Yes, cast iron pipe, by far the lowest in cost per service year of all pipe materials used for underground mains, is now more economical than ever.

In January we announced that our members were making pipe in accordance with the recently adopted A. S. A. LAW OF DESIGN for cast iron pipe in underground service. And that this new Law of Design was the result of our co-operative study with consulting engineers and pipe users under the auspices of the American Standards Association.

This new A. S. A. Law of Design means that the weights and thicknesses of cast iron pipe are *scientifically designed for specific laying conditions.* No more risk of under-guessing. No more over-guessing to be safe. You get the proper thickness for the service required.

Our members will of course continue to manufacture cast iron pipe in accordance with previously established specifications — A. W. W. A. — A. G. A. — Federal Government W W — P — 421. But it will be obvious that the new factors in cast iron pipe design can save thousands of tons of metal with resultant large economies to pipe users.

Thus, cast iron pipe keeps in step with American Industry's swift wartime progress in design and production. Known for *longest life* by official records — proved to be *lowest in maintenance cost* by a nation-wide survey — *salvaged or re-used* by hundreds of cities — it is now scientifically designed for specific laying conditions. And it is more economical than ever. Cast Iron Pipe Research Association, Thomas F. Wolfe, Engineer, Peoples Gas Bldg., Chicago.

CAST IRON PIPE

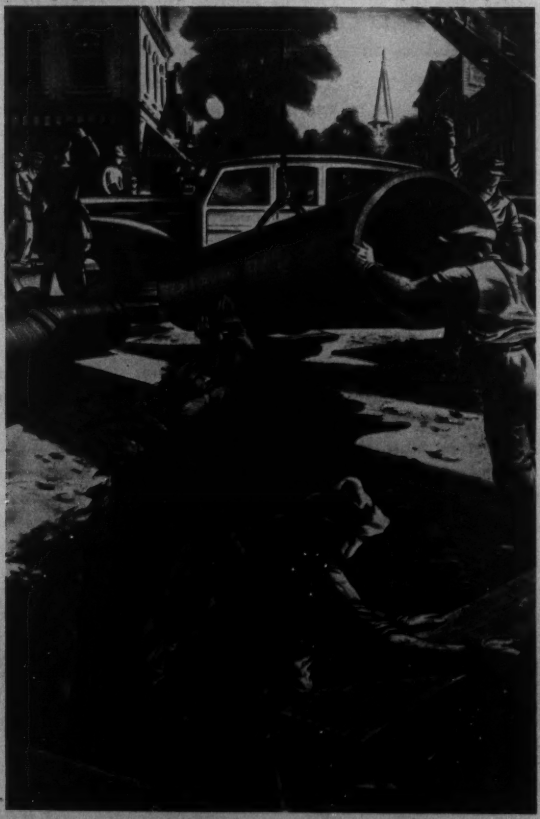
PIPE
U. S. PIPE & FOUNDRY CO.
General Offices: Burlington, N. J.
Plants and Sales Offices throughout the U. S. A.

BY metallurgical controls and analysis of raw materials, we know the *physical characteristics* of the iron used in making Super-de Lavaud Pipe. The pipe is cast centrifugally in a metal mold and heat treated to increase toughness and assure uniformity of metal structure. The finished pipe is subjected to a regularly scheduled series of rigid tests. By these methods and controls, a high standard is attained and maintained—of metal strength, ductility and impact-resistance.

Lithographed on stone by Edward A. Wilson for U. S. Pipe & Foundry Co.



The Journal of the New England Water Works Association

is a quarterly publication, containing the papers read at the meetings, together with reports of the discussions. Many of the contributions are from writers of the highest standing in their profession. It affords a convenient medium for the interchange of information and experience between the members, who are so widely separated as to find frequent meetings an impossibility. Its success has more than met the expectation of its projectors; there is a large and increasing demand for its issues, and every addition to its subscription list is a material aid in extending its field of usefulness.

All members of the Association receive the JOURNAL for two dollars per annum which sum is included in their annual dues; to all others the subscription is four dollars per annum.

TO ADVERTISERS

THE attention of parties dealing in goods used by Water Departments is called the JOURNAL OF THE NEW ENGLAND WATER WORKS ASSOCIATION as an advertising medium.

Its subscribers include the principal WATER WORKS ENGINEERS and CONTRACTORS in the United States. The paid circulation is **1000** COPIES.

Being filled with original matter of the greatest interest to Water Works officials it is PRESERVED and constantly REFERRED TO BY THEM, and advertisers are thus more certain to REACH BUYERS than by any other means.

The JOURNAL is not published as a means of revenue, advertisements being inserted solely to help meet the large expense of publication.

ADVERTISING RATES

One page, one year, four insertions	Eighty Dollars
One-half page, one year, four insertions	Fifty-six Dollars
One-fourth page, one year, four insertions	Thirty-six Dollars
Card size, one year, four insertions	Twelve Dollars
One page, single insertion	Forty Dollars
One-half page, single insertion	Thirty Dollars
One-fourth page, single insertion	Twenty Dollars

Size of page, 4½ x 7½ net.

A sample copy will be sent on application.

613 STATLER BUILDING,
BOSTON, MASS.

LEADITE

Trade Mark Registered U.S. Pat. Office

COSTS ARE REDUCED WHEN *LEADITE* IS USED

Of course, the greatest advantage in using LEADITE, is, that it makes a good, tight joint,—and thus reduces leakage to a minimum,—but LEADITE also offers the following advantages, which are worthy of serious consideration: Saves caulking expenses—Reduces cost of digging large bell-holes —Saves in cost of material—Reduces time required for pumping "wet trenches"—Saves time in preparation—Saves time in handling on the job—Saves in freight and hauling charges.

Another point, LEADITE saves "interest charges" by speeding up the completion of the water line.

The true value of LEADITE is best indicated by the fact that it has been used on THOUSANDS OF MILES of Water Mains,—all over this Country, as well as in many Overseas Countries.

The Pioneer self-caulking material for c. i. pipe,
Tested and used for over 40 years,
Saves at least 75%.
